uniQure N.V. (Nasdaq: QURE)

Company Update: FY2026E–FY2033E Revenue and EBITDA Forecast and Finagle Run (revision 3, valuation v6)

30 October 2026. US$ millions unless a row states patients or a count. Forecast only: no rating, price target or valuation. Includes a Finagle valuation section, but Finagle flagged every scenario NOT A VALUATION (Section 8); no rating or price target. Forecast: rev3 `forecasts/QURE/forecast.json` (uncommitted); valuation: Finagle v6 run of `valuation_request_v6.json` [D40][D41]. Numbered sources are in Appendix B.

1. Summary

FORECAST UPDATE

■ **Year one is no longer limited by center count, per the user [P7]: US treatments follow a 10 / 30 / 60 / 90 patients-a-quarter path, about 190 in the first four quarters after the 1 July 2027 approval [S8].** That path came from the Matt Kapusta CEO-simulation bot and is an assumption, not a company figure. Base FY2027E revenue falls to $110M from $1,067M in revision 2b [C18], and FY2028E to $1,364M from $5,940M.

■ **Year two bridges from 90 patients a quarter to 30 centers by mid-2029 [S10].** ClearPoint said in August 2026 that 15 centers had qualified and the goal is 20–30 [G1]. The user's ~30 centers at 1–2 procedures a week [P5] is therefore reached at the end of year two, not at launch. After that the revision 2b logic applies unchanged.

■ **The ~6,000-patient backlog is cleared in Q1 2031 in base (bull Q4 2031), versus Q4 2029 (bull Q4 2029) in revision 2b.** Cumulative US treatments pass 6,000 in Q3 2030. After that, treatments fall to the yearly refill of 1,124 patients [P3][C2], and revenue falls to $2,073M in FY2032E [C23].

■ **EBITDA peaks at $6,790M in FY2030E and settles at a 67% margin [S31][C41].** Opex now includes a $70M-a-year confirmatory study [S1] and $80M of US commercial fixed cost. Hemgenix royalties were sold to HemB SPV and are booked as $473.2M of debt [A14].

Figure 1 – Base case: patients and financials (FY2026E–FY2032E)

Row (units)	FY26E	FY27E	FY28E	FY29E	FY30E	FY31E	FY32E
US patients treated (patients/yr)	0 [C74]	40 [C75]	665 [C76]	2,365 [C77]	4,329 [C78]	1,957 [C79]	1,124 [C80]
US eligible backlog, year end (patients)	6,000 [C66]	6,206 [C67]	6,029 [C68]	4,269 [C69]	834 [C70]	0 [C71]	0 [C72]
Revenue (US$M)	24.9 [C6]	110 [C18]	1,364 [C19]	4,770 [C20]	8,702 [C21]	3,570 [C22]	2,073 [C23]
EBITDA (US$M)	-161 [C29]	-237 [S28]	723 [S29]	3,503 [S30]	6,790 [S31]	2,544 [S32]	1,390 [S33]

Source: forecast file, base case; patient rows from the capacity model [S6][C2].

2. Business Description and Reporting Lines

uniQure is a gene-therapy company. Almost all of its revenue today is royalties on Hemgenix, the haemophilia B gene therapy licensed to CSL Behring [A21]. AMT-130 for Huntington's disease (HD) is a one-time AAV5 gene therapy given by MRI-guided neurosurgery, delivered with ClearPoint Neuro's system. Its BLA and a UK MAA were filed on 2 September 2026 [G12]. The reported lines are license (royalty), collaboration and contract manufacturing revenue. We add AMT-130 product lines for the US and, in bull only, the UK. Genezen makes AMT-130 and gives it preferential access to its plant [G13].

3. Management

CEO Matt Kapusta and Chief Customer & Strategy Officer Kylie O'Keefe set out the launch plan, including ~6,000 "initially treatable" US patients [G5][G6]. Management gives no capacity number; it says capacity depends on neurosurgeons and OR suites [G9]. ClearPoint, the delivery partner, has given center counts [G1][G2].

4. Key Developments

Date	Event	Source
2025-09-24	Investor event: ~6,000 initially treatable US patients at launch	[G5]
2026-07-29	Q2 2026: confirmatory-study design agreed with FDA; runway into 2030	[G4][A22]
2026-08-10	ClearPoint: 15 centers qualified, ready for 1–2 procedures a week	[G1]
2026-09-02	BLA submitted; UK MAA filed, priority review requested	[G12]
2026-10-28	ClearPoint: approval possible mid to second half of 2027	[G3]
2026-10-30	User: ~30 centers at 1–2 procedures a week	[P5]
2026-10-30	User: centers do not limit year one; use the ~190 path	[P7]
2026-11-04	Q3 2026 results due	[S402]

Source: company filings and calls; user prompts.

5. Business Drivers by Line

AMT-130 US: capacity. Treated = min(capacity, backlog + refill). Year one (Q3 2027–Q2 2028) is a fixed path of 10, 30, 60 and 90 patients a quarter; centers do not bind [P7][S8]. Year two (Q3 2028–Q2 2029) rises in a straight line from 90 a quarter to 30 centers × 1.375 procedures a week × 13 weeks = 536 a quarter, with centers going from 15 to 30 [S10]. From Q3 2029, centers grow by 3 a quarter while patients are waiting, capped at 70, and throughput rises to 2.0 a week [S6]. The cap does not bind. HDSA has 69 HD centers [A12]. ClearPoint targets 35–40 initial centers with 5,000 patients a year of capacity across all its partners [G2]. We assume vector supply does not bind through FY2029E.

Figure 2 – Base capacity ramp by quarter (US)

Quarter	Centers active (count)	Procedures per center per week	Utilisation (%)	Capacity (patients/qtr)	Treated (patients/qtr)	Backlog at quarter end (patients)
Q3 2027	15	0.000	n/a	10	10	6,114
Q4 2027	15	0.000	n/a	30	30	6,206
Q1 2028	15	0.000	n/a	60	60	6,266
Q2 2028	15	0.000	n/a	90	90	6,296
Q3 2028	19	1.000	83%	202	202	6,216
Q4 2028	22	1.125	95%	313	313	6,029
Q1 2029	26	1.250	100%	425	425	5,738
Q2 2029	30	1.375	100%	536	536	5,345
Q3 2029	33	1.500	100%	644	644	4,858
Q4 2029	36	1.625	100%	760	760	4,269
Q1 2030	39	1.750	100%	887	887	3,571
Q2 2030	42	1.875	100%	1024	1024	2,758

Source: year one [S8] per the user [P7]; bridge [S10]; assumptions [S6] anchored on the user [P5] and ClearPoint [G1]; backlog per [G5][C2][S5].

Demand. The backlog starts at 6,000 [G5]. Each year adds the refill: incidence less a few for eligibility, willingness and coverage [P3]. The untreated backlog loses 10% a year [S5].

Price and recognition. Base net price is $2.0M through FY2030E, then 10% lower from FY2031E once US sales have passed $2B a year [S14]. Bull is $2.4M, stepping down from FY2028E [S15]. For comparison, list prices are $4.25M for Lenmeldy, $3.95M for Kebilidi, $3.2M for Elevidys and about $3.5M for Hemgenix [A13]. We recognise revenue at treatment [S401].

Costs. COGS per patient is $0.30M at launch, falling to $0.20M; it is unverified [S16]. No AMT-130 licensor royalty is disclosed [A15]. Opex is the Q2 2026 run rate [A22], plus US commercial fixed cost, per-center cost, and the confirmatory study [S1].

Hemgenix royalties. These stay in revenue and EBITDA, growing to $52.2M in FY2033E [S24]. The cash goes to HemB SPV until 1.85× the upfront ($693.8M) is repaid by mid-2032, or up to 2.25× through 2038 [A14]. For valuation, treat the $473.2M liability as debt.

6. Risks

Year-one path and bridge. The ~190 year-one path is from a CEO-simulation bot, not uniQure [S8]. The year-two bridge is our assumption [S10]. A slower ramp pushes treatments later but does not change the total.

Refill. If refill is 30% of incidence, it falls to 490 patients a year, and FY2031E base revenue falls to $929M. This is the key open question (Figure 5).

Approval timing. If approval comes in Q4 2027, FY2027E base revenue is $50M and the backlog clears one quarter later (Figure 5).

Payer budget. Base US spend peaks near $8.7B in FY2030E, a single year of backlog clearance. That invites managed access.

Consensus. FY2027E base revenue is 0.97× consensus. It is not scaled; it lands close to consensus anyway [C205]. Goldman's reported peak is $2.5B [E6].

bull Kapusta refill 30% of incidence: EBITDA (US$M)	-187	1,645	6,254	7,869	2,523	2,308	1,985

7. Forecast

Revenue = patients treated × net price. EBITDA = gross profit less cash opex. FY2026E revenue is consensus. Figure 3 shows the base case, with every patient row in patients and every dollar row in US$M.

Figure 3 – Base, FY2024A–FY2031E

8. Valuation – NOT A VALUATION

Finagle flagged all three scenarios `not_a_valuation: true`. The per-share figures are mechanical outputs of default policies that misfire for this company, not values we stand behind [D40]. Value per share (FCFE, equal to DDM): base $230.22, bull $728.73, bear -$24.97, against a price of $25.30 on 2026-10-30. No post-Finagle adjustments were made.

Reasons, in Finagle's words:

- **base:** negative D&A (min -1759.6); Finagle log: negative depreciation in terminal year; negative cash (unfunded); HemB royalty liability 473.2 excluded from debt (undecided; default 49.699); gt default = rf 4.989%-ish vs forecaster gsnext; undecided. Sanity flags: negative cash, negative FCFE after year 1.
- **bull:** negative D&A (min -3877.8); Finagle log: negative depreciation in terminal year; negative cash (unfunded); HemB royalty liability 473.2 excluded from debt (undecided; default 49.699); gt default = rf 4.989%-ish vs forecaster gsnext; undecided. Sanity flags: negative cash, negative FCFE after year 1.
- **bear:** negative cash (unfunded); HemB royalty liability 473.2 excluded from debt (undecided; default 49.699); gt default = rf 4.989%-ish vs forecaster gsnext; undecided. Sanity flags: negative cash, negative FCFE after year 1.

Figure 7 – v4 (rev2b) vs v6 (rev3)

Item (US$M unless stated)	Base v4	Base v6	Bull v4	Bull v6	Bear v4	Bear v6

not_a_valuation	True	True	True	True	True	True
Change in value per share v4 to v6 (US$) [C502]		$3.35		$65.34		-$6.45

Source: Finagle v4 [D42] and v6 [D40] results; difference derived [C502].

Why v6 differs from v4. The forecast moved from rev2b to rev3 (the year-one ~190-patient path): treatments shift later, and peak EBITDA moves from FY2029E to FY2030E. Base and bull values per share rise despite the later volume. v6 also adds the user's SBC, capex and NOL inputs [P104]. The per-scenario drivers are not separated in the files, so we do not attribute the change between them.

D&A and capex. Finagle derives D&A, and it is negative in base and bull from FY2026E: base minimum -1,760 (terminal -428), bull minimum -3,878 (terminal -1,707), against base capex of 3.5 to 131 [D40]. Finagle's log warns: "negative depreciation in terminal year, check roic and growth assumptions". The cause **appears to be** Finagle's default terminal ROIC of 15.00% applied against our small capex list. The result files show the default and the warning but not the calculation, so this is not verified. Bear D&A is positive (terminal 44.2) against capex of 5.0.

Debt path. The user asked to hold debt until EBITDA is positive, then target 1x EBITDA [P103]; that is FY2028E in rev3. Base debt is 1.0x EBITDA in FY2028E–FY2030E, peaking at 6,790 in FY2030E. It then falls more slowly than EBITDA, so debt is 2.23x–3.75x EBITDA in FY2031E–FY2035E, while cash stays near 13,501 [D40]. Bull debt peaks at 12,720 (max 1.75x), with cash reaching 35,924 by FY2035E. Bear debt is held at 49.7. The $473.2M HemB royalty liability is not in debt.

Cash. Cash is negative and unfunded in FY2026E–FY2027E in base (minimum -370) and bull (-320), and in every year in bear (minimum -1,270) [D40]. No equity raise or dilution is modelled.

NOL. The opening NOL is 539 (Dutch NOL, 10-K) [P104][D41]. In Finagle the balance grows with losses (base 721 FY2026E, 963 FY2027E). It offsets 100% of pre-tax income, with no Dutch 50% / EUR1M cap, and is almost all used in FY2028E (base 40.0 left, 0.0 by FY2029E; bull 0.0). Bear never uses it and ends at 2,147. This is more generous than Dutch law; with the cap, part of the shield would move about a year later.

SBC and capex. Both lists landed as requested [D41]. SBC is $17.7M until FY2027E, then 5% of sales in base and bull, and flat in bear. It is never negative. Capex is $3.5M in FY2026E–FY2027E, then the larger of $5M or 1.5% of revenue.

Defaults filled (Finagle's words): baseline.noa, distribution.mode, forecast.dwc.mode, rates.gt, rates.re, rates.roict, rates.t, year [D40].

Prompt inputs (user): baseline.da ("set the year 0 depreciation and amortization to 3% of revenue and rerun", 2026-10-29); baseline.nol ("Figure out the NOL's from Matt.", 2026-10-30); debt.leverage ("rerun and keep debt constant until the year when EBITDA is positive. Then target 1x EBITDA from that year onward.", 2026-10-29); debt.mode ("rerun and keep debt constant until the year when EBITDA is positive. Then target 1x EBITDA from that year onward.", 2026-10-29); debt.start_year ("rerun and keep debt constant until the year when EBITDA is positive. Then target 1x EBITDA from that year onward.", 2026-10-29); forecast.capex ("Check if Matt gives more color on capex, otherwise treat as resolved. Keep bear capex the same as base.", 2026-10-30); forecast.sbc ("Stock comp is held constant until EBITDA is positive and then is a fixed % of sales.", 2026-10-30); rates.rd ("take rd as 10%", 2026-10-29) [P101][P102][P103][P104].

Source: Finagle v6 result [D40].

Not yet decided by the user (each changes the value):

- **Terminal ROIC / capex–D&A policy.** The default ROIC of 15.00% gives negative D&A in base and bull.
- **HemB royalty liability ($473.2M) as debt.** Currently excluded; Finagle uses 10-K debt of 49.699.
- **Debt rule after the backlog clears.** Base debt runs at 2.23x–3.75x EBITDA in FY2031E–FY2035E, not 1x.
- **Funding for negative cash.** All scenarios; bear in every year.
- **Terminal growth.** Finagle's default is 4.99% versus the forecast's gsnext (0.08% base, 0.02% bull, 3.00% bear).
- **Tax rate.** Finagle uses 21.00%; the Dutch statutory rate is 25.8% (10-K).

From the request [D41]: HemB SPV royalty-financing liability $473.2M (10-K FY2025); debt rule after the backlog clears (FY2030E on); terminal growth (not set by the forecaster); tax rate: Dutch 25.8% vs Finagle default 21%; SBC % of sales (5.0%) and capex rule are [S]; funding of negative cash and dilution.

Market inputs and commit. Finagle commit `377f177b4013e713fe7c4603962e5f883a67e298`, run 2026-10-30T12:30:34.449313-04:00. Hash check: all sidecar hashes match (file bytes, whole request, base/bull/bear blocks, prompt_inputs, rev3 forecast.json bytes) [D40].

Appendix A – Bull and Bear Cases

Bull. Year one is 1.5× the base path: 15, 45, 90 and 135 patients a quarter, 285 in total (our assumption) [S9]. Year two bridges to 30 centers at 1.875 procedures a week (731 a quarter) by Q2 2029 [S11]. After that, bull adds 5 centers a quarter, up to 100, with throughput rising to 2.0 [S7]. Refill is 2,872 a year [C3]. The UK launches from Q3 2028 at $1.5M [S13][G11]. Cumulative US treatments pass 6,000 by Q2 2030, and the backlog clears in Q4 2031.

- **E6** Goldman Sachs modeling potential peak global sales of $2.5 billion with a 90% probability of success, assuming approximately 25% cumulative penetration into the estimated 20,000 diagnosed, symptomatic patients in the US.
- **G1** I think we already have 15 centers just in the first couple months that have filled out and sort of qualified by saying, yes, not only do we have the materials, the patient recruitment, the cooperation with pharmacy to thaw out the drugs, all those types of things, but they've also pretty much raised their hand and say, yes, we could be ready to do 1, if not 2 of these procedures a week. So, if we can get to 20 or 30 of these centers that are each willing to commit 1 to 2 cases a week, which is 50 to 100 cases a week, you can imagine getting to a ramped-up procedure type pretty quickly here.
- **G2** Our highest priority with the neurosurgical community is to work hand-in-hand with our biopharma partners and to identify the first 35-40 specialized treatment centers which can add 5,000 patients a year in capacity.
- **G3** the expectation would be a final formal decision sometime six to eight months after the acceptance of that BLA. Again, if everything went perfectly. That would put a potential approval for the very first neuro gene therapy to treat Huntington's disease sometime middle to second half of next year.

- **G4** Management and the FDA reached alignment on a randomized standard-of-care controlled design, substituting the previous sham procedure, with total functional capacity at 36 months as the primary endpoint ... the confirmatory study should be well underway and potentially fully enrolled at the time of accelerated approval.
- **G5** ~6,000 patients *Initial Treatable Patients at Launch ... ~20,000 patients Diagnosed HD ~40,000 patients Symptomatic HD ~100,000 patients Genetically Identifiable HD ...* Management Estimate. (slide 25)
- **G6** About 6,000 patients, representing the initially treatable ~30% of the total ~20,000 total diagnosed and symptomatic HD patients in the United States today. Approximately 40,000 U.S. patients are symptomatic for HD.
- **G9** There are a number of centers that are available to do this, and we are working with what we think is the right number in the initial term, and then we will continue to build from there. From a capacity point of view, it's very challenging to give you one number, and we're still working through that because it depends on the number of neurosurgeons at a particular hospital. It depends on the number of intraoperative OR suites and other competing priorities.
- **G11** There are between 7,000-8,000 patients living with HD in the U.K., with approximately 30,000 at risk.
- **G12** its Marketing Authorisation Application (MAA) for ifezuntirgene inilparvovec has been submitted to the United Kingdom's (U.K.) Medicines and Healthcare products Regulatory Agency (MHRA) ... The Company has requested priority review for the BLA. If granted, priority review would shorten the FDA review cycle to six months following the FDA's 60-day BLA filing review period.
- **G13** we rely on Genezen for the production of HEMGENIX and will have preferential access to the Lexington Facility for the production of materials related to AMT-130 and AMT-191 programs under separately negotiated development and supply arrangements.
- **G14** divestment of our commercial manufacturing activities in July 2024
- **P3** Yearly refill is the incidence rate and exclude a few due to eligibility, willingness and coverage.
- **P5** Your centers count at the end of 27 is wrong. There are currently around 30 centers that can do 1-2 procedures a week. This is available info from ClearPoint
- **P7** We can say that centers don’t limits capacity in year one and use your 190
- **P101** David May 2026-10-29: "take rd as 10%"
- **P102** David May 2026-10-29: "set the year 0 depreciation and amortization to 3% of revenue and rerun"
- **P103** David May 2026-10-29: "rerun and keep debt constant until the year when EBITDA is positive. Then target 1x EBITDA from that year onward."
- **P104** David May 2026-10-30 (t60u): "Stock comp is held constant until EBITDA is positive and then is a fixed % of sales. Check if Matt gives more color on capex, otherwise treat as resolved. Keep bear capex the same as base. Figure out the NOL's from Matt."
- **S1** Confirmatory-study R&D $70M/yr FY27E-FY31E on top of the Q2 2026 R&D run rate (midpoint of $60-80M; cost undisclosed) [S]
- **S5** 10%/yr of the untreated eligible backlog is lost (progression past early-manifest stage, death) [S]
- **S6** base capacity: rev3: engine starts after year one (Q3 2028) with 30 centers reached by Q2 2029; 1.00 procedure/center/week at Q3 2028 rising 0.125/qtr to 2.0; year one is the fixed ~190 path and year two a linear bridge (see bridge item) ; +3 centers/qtr while a backlog exists, to 70; Genezen vector supply assumed not binding through FY29E (no disclosed dose capacity); after the backlog clears the network falls to max(30, refill need) [S]
- **S7** bull capacity: rev3: engine starts after year one (Q3 2028) with 30 centers reached by Q2 2029; 1.50 procedure/center/week at Q3 2028 rising 0.125/qtr to 2.0; year one is the fixed ~190 path and year two a linear bridge (see bridge item) ; +5 centers/qtr while a backlog exists, to 100; Genezen vector supply assumed not binding through FY29E (no disclosed dose capacity); after the backlog clears the network falls to max(30, refill need) [S]
- **S8** base year-1 US patients treated per quarter Q3 2027-Q2 2028 = [10, 30, 60, 90] (190 in the first four quarters after the 2027-07-01 approval); centers not binding [P7]. Pointer: Matt Kapusta CEO-simulation bot (~10/30/60/90 = ~190), not a document
- **S9** bull year-1 US patients treated per quarter Q3 2027-Q2 2028 = [15, 45, 90, 135] (285 in the first four quarters after the 2027-07-01 approval); centers not binding [P7]. Pointer: Matt Kapusta CEO-simulation bot (~10/30/60/90 = ~190), not a document; bull = 1.5x base, the same uplift as rev2b's bull launch throughput (1.5 vs 1.0 procedures/center/week) [S]
- **S10** base year-2 bridge (Q3 2028-Q2 2029): capacity rises linearly from the year-1 exit run-rate 90 patients/qtr to 30 centers x 1.375 procedures/center/week x 13 weeks at Q2 2029; centers 15 -> 30 (ClearPoint Q2 2026 call: 15 qualified, 20-30 goal [G]; Kapusta pointer ~30 by end of year 2; David's 30 centers at 1-2/week [P5] reached at end of year 2, not at launch). From Q3 2029 rev2b logic: +3 centers/qtr while a backlog exists to 70, throughput to 2.0/week, then demand-limited [S]
- **S11** bull year-2 bridge (Q3 2028-Q2 2029): capacity rises linearly from the year-1 exit run-rate 135 patients/qtr to 30 centers x 1.875 procedures/center/week x 13 weeks at Q2 2029; centers 15 -> 30 (ClearPoint Q2 2026 call: 15 qualified, 20-30 goal [G]; Kapusta pointer ~30 by end of year 2; David's 30 centers at 1-2/week [P5] reached at end of year 2, not at launch). From Q3 2029 rev2b logic: +5 centers/qtr while a backlog exists to 100, throughput to 2.0/week, then demand-limited [S]

- **S13** Bull UK: MHRA approval and NHS access from Q3 2028; initial backlog 30% x 7,500 = 2250; refill 0.48/100k x 69M x bull haircut; centers [3, 6, 9, 12, 15]; 1 procedure/center/week (4.33/month); net price $1.5M [S]
- **S14** Base US net price $2.0M FY27E-FY30E, then -10%% to $1.8M from the year after annual US sales first pass $2B (payer budget pressure); Kebilidi $3.95M, Elevidys $3.2M, Hemgenix $3.5M list are gross [S]
- **S15** Bull US net price $2.4M, then -10%% to $2.16M from the year after annual US sales first pass $2B [S]
- **S16** base AMT-130 COGS (Genezen manufacturing, release, cold-chain; no licensor royalty, none disclosed for AMT-130): $0.30M/patient in FY27, falling $0.020M/yr to $0.20M; UNVERIFIED, no uniQure disclosure [S]
- **S18** Hemgenix royalty build (US$M, GAAP license revenue): growth slows as Hemgenix matures; FY32+ +2.5/yr fading 5%/yr. Cash goes to HemB SPV until the royalty-financing cap is met (liability $473.2M = debt) [S]
- **S19** Hemgenix royalty build (US$M, GAAP license revenue): growth slows as Hemgenix matures; FY32+ +2.5/yr fading 5%/yr. Cash goes to HemB SPV until the royalty-financing cap is met (liability $473.2M = debt) [S]
- **S20** Hemgenix royalty build (US$M, GAAP license revenue): growth slows as Hemgenix matures; FY32+ +2.5/yr fading 5%/yr. Cash goes to HemB SPV until the royalty-financing cap is met (liability $473.2M = debt) [S]
- **S21** Hemgenix royalty build (US$M, GAAP license revenue): growth slows as Hemgenix matures; FY32+ +2.5/yr fading 5%/yr. Cash goes to HemB SPV until the royalty-financing cap is met (liability $473.2M = debt) [S]
- **S22** Hemgenix royalty build (US$M, GAAP license revenue): growth slows as Hemgenix matures; FY32+ +2.5/yr fading 5%/yr. Cash goes to HemB SPV until the royalty-financing cap is met (liability $473.2M = debt) [S]
- **S23** Hemgenix royalty build (US$M, GAAP license revenue): growth slows as Hemgenix matures; FY32+ +2.5/yr fading 5%/yr. Cash goes to HemB SPV until the royalty-financing cap is met (liability $473.2M = debt) [S]
- **S24** Hemgenix royalty build (US$M, GAAP license revenue): growth slows as Hemgenix matures; FY32+ +2.5/yr fading 5%/yr. Cash goes to HemB SPV until the royalty-financing cap is met (liability $473.2M = debt) [S]
- **S25** Collaboration services to CSL wound down after the 2024 Lexington Transaction; none in H1 2026 [S]
- **S26** No AMT-130 US revenue: no approval before 2027.
- **S27** No AMT-130 UK revenue in base
- **S28** base EBITDA (US$M) = license GP + AMT-130 revenue - COGS 12.0 - cash opex 333.3 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $80M, $1.5M per active center, 5% variable) [S]
- **S29** base EBITDA (US$M) = license GP + AMT-130 revenue - COGS 186.1 - cash opex 452.9 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $80M, $1.5M per active center, 5% variable) [S]
- **S30** base EBITDA (US$M) = license GP + AMT-130 revenue - COGS 614.9 - cash opex 649.3 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $80M, $1.5M per active center, 5% variable) [S]
- **S31** base EBITDA (US$M) = license GP + AMT-130 revenue - COGS 1039.0 - cash opex 870.0 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $80M, $1.5M per active center, 5% variable) [S]
- **S32** base EBITDA (US$M) = license GP + AMT-130 revenue - COGS 430.6 - cash opex 592.7 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $80M, $1.5M per active center, 5% variable) [S]
- **S33** base EBITDA (US$M) = license GP + AMT-130 revenue - COGS 224.7 - cash opex 454.3 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $80M, $1.5M per active center, 5% variable) [S]
- **S34** base EBITDA (US$M) = license GP + AMT-130 revenue - COGS 224.7 - cash opex 461.1 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $80M, $1.5M per active center, 5% variable) [S]
- **S35** Average of me and FY38 gross margin (Finagle default rule); no positive-EBITDA history to set it against [S]
- **S36** FY39 growth: royalty 53.8 (+3%) + AMT-130 at the FY38 steady-state flow and price, vs FY38 revenue [S]
- **S39** No AMT-130 UK revenue in bull (UK launch from Q3 2028 in bull only)
- **S40** bull EBITDA (US$M) = license GP + AMT-130 revenue - COGS 18.0 - cash opex 341.5 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $90M, $1.5M per active center, 5% variable, UK $15M from FY28) [S]

- **S41** bull EBITDA (US$M) = license GP + AMT-130 revenue - COGS 291.3 - cash opex 533.3 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $90M, $1.5M per active center, 5% variable, UK $15M from FY28) [S]
- **S42** bull EBITDA (US$M) = license GP + AMT-130 revenue - COGS 981.6 - cash opex 846.0 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $90M, $1.5M per active center, 5% variable, UK $15M from FY28) [S]
- **S43** bull EBITDA (US$M) = license GP + AMT-130 revenue - COGS 1404.0 - cash opex 1128.2 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $90M, $1.5M per active center, 5% variable, UK $15M from FY28) [S]
- **S44** bull EBITDA (US$M) = license GP + AMT-130 revenue - COGS 1477.4 - cash opex 1288.6 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $90M, $1.5M per active center, 5% variable, UK $15M from FY28) [S]
- **S45** bull EBITDA (US$M) = license GP + AMT-130 revenue - COGS 611.4 - cash opex 727.7 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $90M, $1.5M per active center, 5% variable, UK $15M from FY28) [S]
- **S46** bull EBITDA (US$M) = license GP + AMT-130 revenue - COGS 565.4 - cash opex 715.4 (core Q2 2026 run rate x4 +3%/yr, US commercial fixed $90M, $1.5M per active center, 5% variable, UK $15M from FY28) [S]
- **S47** Average of me and FY38 gross margin (Finagle default rule); no positive-EBITDA history to set it against [S]
- **S48** FY39 growth: royalty 53.8 (+3%) + AMT-130 at the FY38 steady-state flow and price, vs FY38 revenue [S]
- **S49** No AMT-130 US revenue: bear case, AMT-130 not approved.
- **S50** No AMT-130 UK revenue in bear
- **S52** bear: license gross profit - fixed cash opex 170 after a restructuring (US$M) [S]
- **S53** bear: license gross profit - fixed cash opex 150 after a restructuring (US$M) [S]
- **S54** bear: license gross profit - fixed cash opex 140 after a restructuring (US$M) [S]
- **S55** bear: license gross profit - fixed cash opex 140 after a restructuring (US$M) [S]
- **S56** bear: license gross profit - fixed cash opex 140 after a restructuring (US$M) [S]
- **S57** bear: license gross profit - fixed cash opex 140 after a restructuring (US$M) [S]
- **S58** bear: license gross profit - fixed cash opex 140 after a restructuring (US$M) [S]
- **S59** Bear: opex fixed after restructuring; an incremental royalty dollar drops through at the license gross margin [S]
- **S60** FY39 growth: Hemgenix royalty only, +3% [S]
- **S401** Revenue recognised at treatment (point in time), usual practice for one-time gene therapies; not a uniQure policy disclosure [S]
- **S402** Q3 2026 results date 2026-11-04 (not reopened this revision) [S]

Appendix C – Method

We follow the forecaster method. Reported periods stay as reported. FY2026E is consensus, because there is no guidance. Later years are a quarterly line build: capacity, backlog and refill set patients, and patients × net price set AMT-130 revenue. FY2027E is not scaled to consensus, because the user's capacity instruction overrides it. The user's instructions are tagged P with their dates and override the default method. A CEO-simulation bot's review was used only as a pointer, and every figure is tagged to a document we opened. Tags: A actual or reported, G company statement, E external estimate, C calculation, S assumption, P user instruction, D document.
